

WHY BE SCREENED FOR CANCER?

Screening can detect cancer early which is important because when abnormal tissue or cancer is found early, it may be easier to treat. By the time cancer symptoms appear, cancer may have begun to spread to other organs in the body making it harder to treat.

Examples of cancer screening tests are the mammogram for breast cancer, colonoscopy and FIT (Fecal Immunochemical Test) for colon cancer, the Pap Smear and HPV (Human Papillomavirus) tests for cervical cancer and the DRE (Digital Rectal Exam) and PSA (Prostate-Specific Antigen) tests for prostate cancer.

Screening can also include checking for risk of developing an inherited disease by doing a genetic test.
