

**Bridgeton Landfill Health Consultation**  
**Summary of Differences between the 2018 Public Comment Version and 2022 Final Version**

While the conclusions of the health consultation have not changed, several revisions have been made to the main body of the document to help clarify the public health assessment process and the findings of this report. This final version includes the following:

- DHSS/ATSDR responses to public comments and questions about the September 2018 public comment version of the document (Appendix G)
- Additional ambient air data collected by DNR near the landfill. Data from 2013 to 2018 are evaluated in this report and are included in graphs and data tables.
- Statistical analyses conducted in accordance with ATSDR's 2019 exposure point concentration guidance to estimate long-term average concentrations and show the significance of data trends (See the "Exposure Evaluation and Chemical Screening Analysis" and "Public Health Implications" sections)
- Updated figures and tables
- In response to public comments:
  - Additional information on the role and involvement of DHSS at the site (see the "Community Health Concerns" section)
  - Lifetime benzene cancer risk value (see Conclusion 5 "Basis for Decision" and the "Cancer Risk" section)
  - Recommendations for timely release of any future data at the site (see "Next Steps" and "Recommendations" sections)
