

YEARS OF POTENTIAL LIFE LOST (YPLL) DUE TO HEROIN OVERDOSE

2013 - 2018

Source: Bureau of Health Care Analysis and Data Dissemination, Missouri Department of Health and Senior Services and WONDER, Centers for Disease Control and Prevention

From 2013-2018, Missouri consistently had a higher Years of Potential Life Lost (YPLL) rates than the United States for heroin-involved overdose. The United States' rate rapidly increased 2013-2016, but has since stabilized. Missouri's rate has generally increased, but with more fluctuations. U.S. data for 2018 is not yet available, so a rate consistent with 2017 has been assumed.
