Teens with poor oral health were 4 TIMES MORE LIKELY to earn lower grades.

3 IN 10 low-income adults say the appearance of their mouth/teeth “affects my ability to interview for a job.”

Drinking fluoridated water reduces tooth decay by 25% for adults and children.

After fluoridation ended in an Alaskan city, the average low-income child had 1 MORE cavity-related treatment each year.

6,600+ research papers have been published on fluoridation — strengthening our knowledge of its benefits and safety.

In the early 1960s, before fluoridation was common, the average adult had 18 decayed, missing or filled teeth.
