

SCHOOL NURSES

THE KEY TO GOOD ORAL HEALTH DURING COVID-19

Tooth decay is the most common chronic disease during childhood. If left untreated, tooth decay can cause pain and serious infections. Children with toothaches are 4 times more likely to have lower grades.

42%

The percentage of kindergarten children that have had tooth decay.

23%

The percentage of low-income children with untreated tooth decay.

Because of COVID-19, many children are not getting the dental care they need.

By doing verbal assessments or dental screenings, school nurses play a critical role in identifying children in need of dental care.

VERBAL ASSESSMENT:

- Ask child if they have a toothache, teeth that hurt when eating, or teeth that wake them at night
- Look for signs of oral problems such as flinching/grimacing while eating or holding their face

DENTAL SCREENING:

- Simple, quick, non-invasive assessment of a child's oral health
- Use a penlight to look for obvious signs of tooth decay
- Ideal in-school tool for triaging children
- Classifies children as
 - Having no obvious problems
 - Needing non-urgent dental care
 - Needing immediate/urgent dental care
