C. <u>Medical Evaluation</u> (Section C to be completed by Health Care Provider – if needed)

Health Care Provider: If the answer to any of the TB Risk Assessment questions in Section B is YES or NO RESPONSE, proceed with additional medical evaluation as appropriate. Additional evaluation may include one or more of the following: TST, IGRA, sign and symptom review, chest x-ray, or sputum collection. If the patient is immunosuppressed and no previous TB test is documented, an IGRA is recommended.

1. **Tuberculin Skin Test (TST)** - Please provide a 2-step TST for those at high risk that have no documentation of a previous TST: Administer 1st step TST today and read in 48-72 hrs, if the 1st step TST is positive, document the results in millimeters (mm)of induration and follow the evaluation steps for a positive TST. If the 1st step TST is negative document the results in mm of induration. Results of mm of induration, transverse diameter; if no induration write "0" mm. The TST interpretation* should be based on mm of induration as well as risk factors. Place a 2-step TST in one to three weeks after the first TST was read and recorded. The 2-step should be read in 48-72 hrs and then follow the documentation procedures as outlined above .
