

State of Missouri regional COVID-19 hospitalized cases model

March 9, 2021

Multiple data points inform Missouri's COVID-19 response

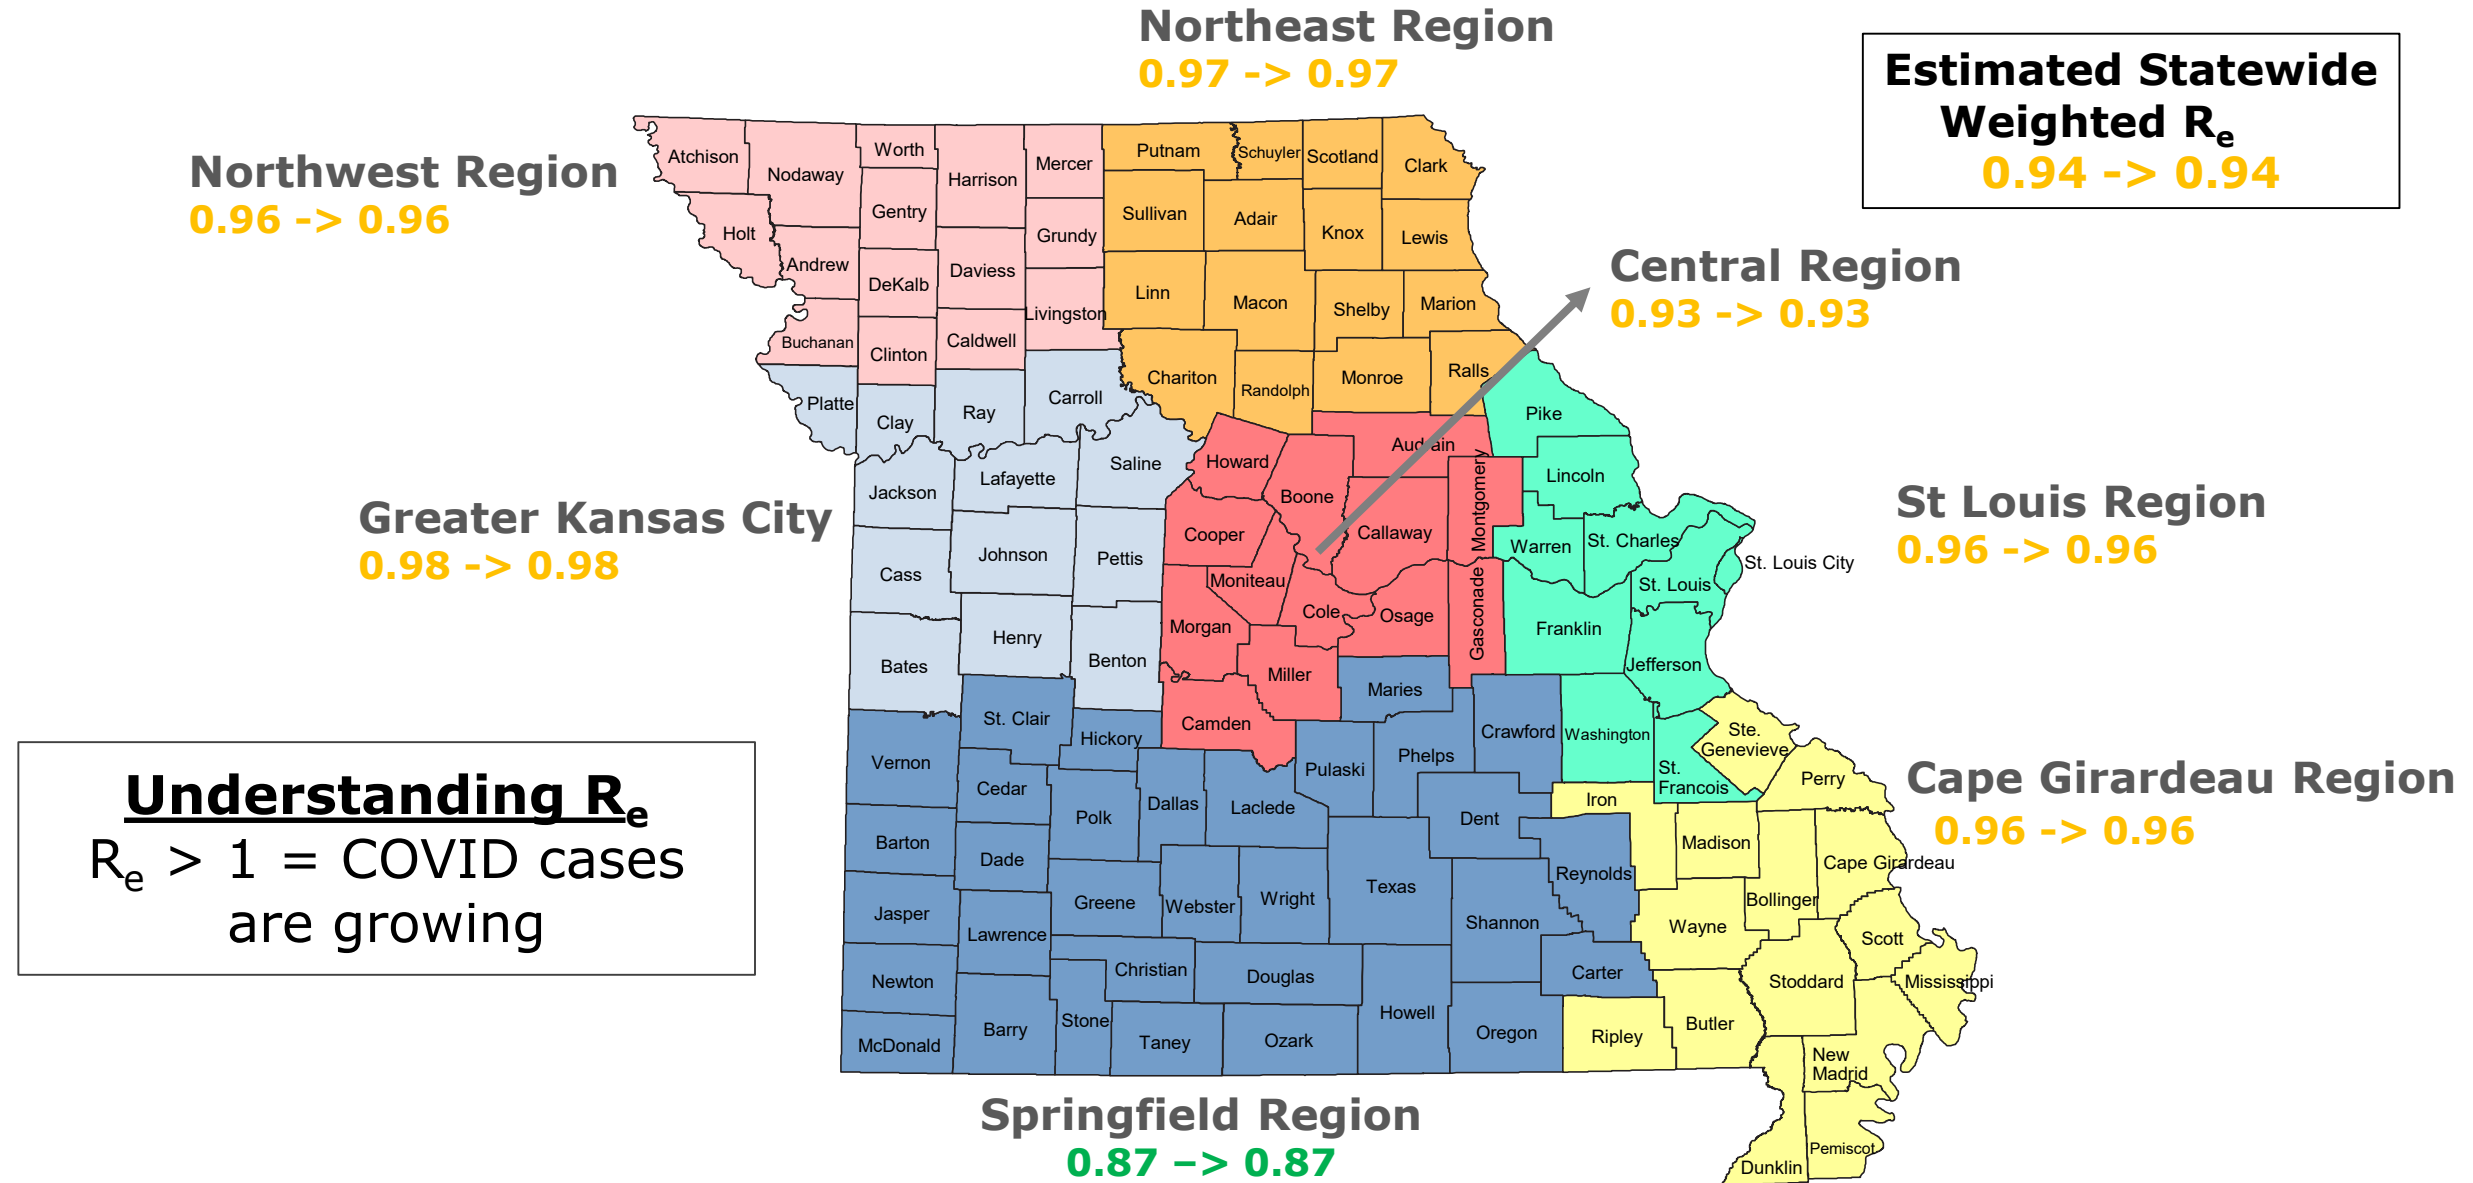

- Syndromic surveillance
- Healthcare system capacity (bed, PPE, and staff availability)
- Testing
- COVID-19 cases and deaths
- Economic and social impact
- Insights from U.S. states, nationally, and other countries
- Evidence from scientific literature
- Mathematical disease modelling

Our model estimates possible outcomes based on currently available information

What does the model tell us	What does it not tell us
Range of plausible outcomes based on our current knowledge of COVID-19 in Missouri	What will happen in the future
Approximate date and magnitude of peak/s based on current understanding of policy interventions and human behavior and assumptions about future interventions	Date and magnitude of peak/s if there are major changes in planned policy interventions and human behavior
Approximate estimate of effective transmission rate across a region	Exact transmission rate in all parts of a region – there may be areas of higher and lower transmission within the region
Projected hospitalizations for regions in MO with sufficient data, i.e. Kansas City Area, Central, St. Louis Area, Southeast and Southwest	Projected hospitalizations in regions where daily COVID-19 hospitalizations are fewer than 15 because insufficient cases

The ability to forecast depends on the quality and availability of data. For a new disease such as COVID-19, much remains uncertain.

- Transmission rates (" R_e ") remain constant and below 1 in all Regions

Central (Region F)

Overview	
Population	502,486
Cumulative Cases	45812
Cumulative Deaths	606
7-day New Cases	160
WoW % Case Change	0.4%

Reproductive Rate	
Pre-intervention	2.3
Last Week	0.93
Current Week	0.93
WoW % Change	0.0%

Bed / Ventilator Availability	
% ICU Beds Occupied	63%
% ICU Beds Occupied C19	4%
% ICU Beds Free	37%
% Ventilators in use	24%
% Ventilators available	76%

Base Case Central Region

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Model Scenario: Base Case, From Date: Mar 1, 2020, To Date: 3/22/21 1:00 AM, + 2 more

Greater Kansas City Area (Region A)

Overview

Population	1,395,314
Cumulative Cases	105882
Cumulative Deaths	1554
7-day New Cases	557
WoW % Case Change	0.5%

Reproductive Rate

Pre-intervention	2.8
Last Week	0.98
Current Week	0.98
WoW % Change	0.1%

Bed / Ventilator Availability

% ICU Beds Occupied	72%
% ICU Beds Occupied C19	6%
% ICU Beds Free	28%
% Ventilators in use	23%
% Ventilators available	77%

Base Case Kansas City Region

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Model Scenario: Base Case, From Date: Mar 1, 2020, To Date: 3/22/21 1:00 AM, + 2 more

Hospitalizations

Northeast (Region B)

Overview

Population	179,448
Cumulative Cases	13263
Cumulative Deaths	195
7-day New Cases	55
WoW % Case Change	0.4%

Reproductive Rate

Pre-intervention	N/A
Last Week	0.97
Current Week	0.97
WoW % Change	0.0%

Bed / Ventilator Availability

% ICU Beds Occupied	32%
% ICU Beds Occupied C19	0%
% ICU Beds Free	68%
% Ventilators in use	5%
% Ventilators available	95%

Base Case Northeast Region

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Model Scenario: Base Case, From Date: Mar 1, 2020, To Date: 3/22/21 1:00 AM, + 2 more

Hospitalizations

Northwest (Region H)

Overview

Population	234,361
Cumulative Cases	18765
Cumulative Deaths	418
7-day New Cases	60
WoW % Case Change	0.3%

Reproductive Rate

Pre-intervention	1.24
Last Week	0.96
Current Week	0.96
WoW % Change	0.2%

Bed / Ventilator Availability

% ICU Beds Occupied	53%
% ICU Beds Occupied C19	6%
% ICU Beds Free	47%
% Ventilators in use	7%
% Ventilators available	93%

Base Case Northwest Region

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Model Scenario: Base Case, From Date: Mar 1, 2020, To Date: 3/22/21 1:00 AM, + 2 more

Hospitalizations

Southeast / Cape Girardeau (Region E)

Overview

Population	363,478
Cumulative Cases	32357
Cumulative Deaths	493
7-day New Cases	128
WoW % Case Change	0.4%

Reproductive Rate

Pre-intervention	2.61
Last Week	0.96
Current Week	0.96
WoW % Change	-0.1%

Bed / Ventilator Availability

% ICU Beds Occupied	61%
% ICU Beds Occupied C19	4%
% ICU Beds Free	39%
% Ventilators in use	26%
% Ventilators available	74%

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Hospitalizations

Southwest / Springfield (Regions D,G, I)

Overview

Population	1,221,847
Cumulative Cases	92274
Cumulative Deaths	1751
7-day New Cases	461
WoW % Case Change	0.5%

Reproductive Rate

Pre-intervention	2.36
Last Week	0.87
Current Week	0.87
WoW % Change	-0.2%

Bed / Ventilator Availability

% ICU Beds Occupied	79%
% ICU Beds Occupied C19	8%
% ICU Beds Free	21%
% Ventilators in use	25%
% Ventilators available	75%

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Hospitalizations

Greater St Louis Area (Region C)

Overview

Population	2,229,518
Cumulative Cases	172299
Cumulative Deaths	3151
7-day New Cases	993
WoW % Case Change	0.6%

Reproductive Rate

Pre-intervention	3.39
Last Week	0.96
Current Week	0.96
WoW % Change	0.0%

Bed / Ventilator Availability

% ICU Beds Occupied	79%
% ICU Beds Occupied C19	8%
% ICU Beds Free	21%
% Ventilators in use	31%
% Ventilators available	69%

Base Case St. Louis Region

* % of occupied ICU beds taken by COVID-19 PUI/Confirmed patients

Model Scenario: Base Case, From Date: Mar 1, 2020, To Date: 3/22/21 1:00 AM, + 2 more

Hospitalizations

Version 1.0, As of June 3, 2020

Model Overview

One of the many data analyses that inform Missouri's COVID-19 response is a regional model of hospitalized COVID-19 cases that the State of Missouri developed in partnership with the Washington University in St. Louis and Missouri Hospital Association.

Missouri's model uses a standard SEIR (susceptible, exposed, infectious, recovered) compartmental structure that is based upon a tool called LEMMA (Local Epidemiological Modeling for Management & Action), which was developed by experts from UMass Amherst, UC Berkeley, UCSF, and WUSTL. The model focuses on COVID-19 hospitalized cases to directly address the question of hospital capacity and provide a more accurate picture of COVID-19's impact on the healthcare system.

To help inform decisions at the regional and local level, each region is modeled separately using the latest local data, including COVID-19 confirmed and suspected hospitalizations, population, policy interventions, and average hospital length of stay.

General FAQs

Why are regional models of COVID-19 important?

When new diseases such as COVID-19 emerge, there is much uncertainty about how best to control the epidemic. Decision makers must make the best possible decisions with the available information at hand.

Mathematical models are commonly used to make projections of how infectious diseases might impact key outcomes such as hospitalized cases or deaths. Today, there are many sophisticated models of COVID-19 that make global or national projections (e.g., Imperial College, Harvard, [JHU](#)). However, these generally do not incorporate key local or regional inputs, such as variations in local population demographics, healthcare system

knowledge of COVID-19 in each region effective transmission rates across projected into the future based upon future.

hospitals serve patients across Highway Patrol Troop and Healthcare and response planning. There are

patient referral and EMS patterns, Troop C (i.e., the Greater St. Louis area) due to their engagement with the

Low levels of daily COVID-19 hospitalizations in the Northeast and Northwest regions limit the ability to generate projections for these regions. In particular, the numbers of hospitalized cases have been so low that

Northeast MO)?

Regional COVID-19 transmission models help inform local policy, public health, and business decisions

- Mathematical models are commonly used to make projections of infectious disease epidemics (e.g., tuberculosis, HIV)
- Many sophisticated models on COVID-19 make global or national projections (e.g., Imperial College, Harvard, IHME)
- However, these generally do not incorporate critical local or regional inputs, such as:
 - Variations in local population size and age structure
 - Date and nature of social distancing and other policies
- Regional projections are important because:
 - Regional epidemics may differ markedly from the national average
 - Policy response occurs at state, county, and municipal levels

State of MO, WUSTL, and MHA have developed a regional model of hospitalized COVID-19 cases

- **Standard SEIR model that combines universal characteristics of COVID-19 infection (e.g., transmission parameters) with local inputs to support regional decision making**
 - Mathematical model developed by experts from UMass Amherst, UC Berkeley, UCSF, and WUSTL
 - Uses a statistical approach that adjusts underlying parameters as new data are observed
- **Customized using the latest local data from Missouri's emergency response regions, including:**
 - COVID-19 positives and PUIs
 - Population and age structure
 - Policy interventions
 - Avg. hospital length of stay
- **Projects COVID-19 hospitalized cases** to directly address the question of hospital capacity and provide a more accurate picture on COVID-19's impact on the healthcare system

Model Structure (SEIR)
