

# State of Missouri regional COVID-19 hospitalized cases model

June 24<sup>th</sup>, 2020

# Multiple data points inform Missouri's COVID-19 response

- Syndromic surveillance
- Healthcare system capacity (bed, PPE, and staff availability)
- Testing
- COVID-19 cases and deaths
- Economic and social impact
- Insights from U.S. states, nationally, and other countries
- Evidence from scientific literature
- Mathematical disease modelling

## Our model estimates possible outcomes based on currently available information

What does the model tell us	What does it not tell us
Range of plausible outcomes based on our current knowledge of COVID-19 in Missouri	What will happen in the future
Approximate date and magnitude of peak/s based on current understanding of policy interventions and human behavior and assumptions about future interventions	Date and magnitude of peak/s if there are major changes in planned policy interventions and human behavior
Approximate estimate of effective transmission rate across a region	Exact transmission rate in all parts of a region – there may be areas of higher and lower transmission within the region
Projected hospitalizations for regions in MO with sufficient data, i.e. Kansas City Area, Central, St. Louis Area, Southeast and Southwest	Projected hospitalizations in regions where daily COVID-19 hospitalizations are fewer than 15 because insufficient cases

**The ability to forecast depends on the quality and availability of data. For a new disease such as COVID-19, much remains uncertain.**

# Greater Kansas City area (Region A)

## Overview

Population: 1,395,314

Cumulative cases: 4,174

Cumulative deaths: 85

7-day new cases: 474

Week-over-week % case increase: 13%

## Reproductive rate

Pre-intervention:  $2.80 \pm 0.15$

Today:  $1.16 \pm 0.09$

Change from last week:  $\uparrow 0.09$

## Projected COVID-19 hospitalizations

### Kansas City Region

Scenario: Base Case, From Date: 3/1/20 1:00 AM, + 3 more

# Greater St. Louis area (Region C)

## Overview

Population: 2,229,518

Cumulative cases: 9,538

Cumulative deaths: 807

7-day new cases: 478

Week-over-week % case increase: 5%

## Reproductive rate

Pre-intervention:  $3.39 \pm 0.14$

Today:  $1.12 \pm 0.11$

Change from last week:  $\uparrow 0.07$

## Projected COVID-19 hospitalizations

### St. Louis Region

Scenario: Base Case, From Date: 3/1/20 1:00 AM, + 3 more

# Southwest / Springfield (Regions D,G, I)

## Overview

Population: 1,221,847

Cumulative cases: 1,552

Cumulative deaths: 14

7-day new cases: 723

Week-over-week % case increase: 87%

## Reproductive rate

Pre-intervention:  $2.36 \pm 0.16$

Today:  $1.15 \pm 0.05$

Change from last week:  $\uparrow 0.01$

## Projected COVID-19 hospitalizations

Note: Due to low levels of hospitalized COVID-19 cases, modelling projections are highly sensitive to slight shifts in observed data and must be interpreted with extra caution.

Source: State of MO, MHA, WUSTL analysis; USA Facts; US Census Bureau

# Southeast / Cape Girardeau (Region E)

## Overview

Population: 363,478

Cumulative cases: 920

Cumulative deaths: 33

7-day new cases: 105

Week-over-week % case increase: 13%

## Reproductive rate

Pre-intervention: **2.61**  $\pm$  0.15

Today: **1.35**  $\pm$  0.07

Change from last week: **↓0.05**

## Projected COVID-19 hospitalizations

### Southeast Region

Scenario: Base Case, From Date: 3/1/20 1:00 AM, + 3 more

Note: Due to low levels of hospitalized COVID-19 cases, modelling projections are highly sensitive to slight shifts in observed data and must be interpreted with extra caution.

Source: State of MO, MHA, WUSTL analysis; USA Facts; US Census Bureau

# Central (Region F)

## Overview

Population: 736,847

Cumulative cases: 665

Cumulative deaths: 7

7-day new cases: 96

Week-over-week % case increase: 17%

## Reproductive rate

Pre-intervention:  $2.30 \pm 0.08$

Today:  $1.11 \pm 0.13$

Change from last week:  $\uparrow 0.02$

## Projected COVID-19 hospitalizations

Note: Due to low levels of hospitalized COVID-19 cases, modelling projections are highly sensitive to slight shifts in observed data and must be interpreted with extra caution.

# Missouri's Regional COVID-19 Hospitalized Cases Model: Overview and Frequently Asked Questions

## Model Overview

One of the many data analyses that inform Missouri's COVID-19 response is a regional model of hospitalized COVID-19 cases that the State of Missouri developed in partnership with the Washington University in St. Louis and Missouri Hospital Association.

Missouri's model uses a standard SEIR (susceptible, exposed, infectious, recovered) compartmental structure that is based upon a tool called LEMMA (Local Epidemiological Modeling for Management & Action), which was developed by experts from UMass Amherst, UC Berkeley, UCSF, and WUSTL. The model focuses on COVID-19 hospitalized cases to directly address the question of hospital capacity and provide a more accurate picture of COVID-19's impact on the healthcare system.

```

graph LR
    Susceptible --> Exposed
    Exposed --> Infectious
    Infectious --> Removed
    Infectious --> Hospitalized
    Hospitalized --> Removed
    Hospitalized --> Floor
    Hospitalized --> ICU
    Hospitalized --> Vent
    
```

To help inform decisions at the regional and local level, each region is modeled separately using the latest local data, including COVID-19 confirmed and suspected hospitalizations, population, policy interventions, and average hospital length of stay.

## General FAQs

### Why are regional models of COVID-19 important?

When new diseases such as COVID-19 emerge, there is much uncertainty about how best to control the epidemic. Decision makers must make the best possible decisions with the available information at hand.

Mathematical models are commonly used to make projections of how infectious diseases might impact key outcomes such as hospitalized cases or deaths. Today, there are many sophisticated models of COVID-19 that make global or national projections (e.g., Imperial College, Harvard, UME). However, these generally do not incorporate key local or regional inputs, such as variations in local population demographics, healthcare system

knowledge of COVID-19 in each region, effective transmission rates across regions, and the ability to project future cases into the future based upon current data.

Hospitals serve patients across the state.

The Missouri State Highway Patrol Troop and Healthcare providers are involved in response planning. There are many factors that influence the response.

The model also considers patient referral and EMS patterns, which are critical to the healthcare system.

The model also considers the role of Troop C (i.e., the Greater St. Louis area) due to their engagement with the healthcare system.

St. Louis

Northwest Missouri]

Low levels of daily COVID-19 hospitalizations in the Northeast and Northwest regions limit the ability to generate projections for these regions. In particular, the numbers of hospitalized cases have been so low that

# Appendix

## Regional COVID-19 transmission models help inform local policy, public health, and business decisions

- Mathematical models are commonly used to make projections of infectious disease epidemics (e.g., tuberculosis, HIV)
- Many sophisticated models on COVID-19 make global or national projections (e.g., Imperial College, Harvard, IHME)
- However, these generally do not incorporate critical local or regional inputs, such as:
  - Variations in local population size and age structure
  - Date and nature of social distancing and other policies
- Regional projections are important because:
  - Regional epidemics may differ markedly from the national average
  - Policy response occurs at state, county, and municipal levels

# State of MO, WUSTL, and MHA have developed a regional model of hospitalized COVID-19 cases

- **Standard SEIR model that combines universal characteristics of COVID-19 infection (e.g., transmission parameters) with local inputs to support regional decision making**
  - Mathematical model developed by experts from UMass Amherst, UC Berkeley, UCSF, and WUSTL
  - Uses a statistical approach that adjusts underlying parameters as new data are observed
- **Customized using the latest local data from Missouri's emergency response regions, including:**
  - COVID-19 positives and PUIs
  - Population and age structure
  - Policy interventions
  - Avg. hospital length of stay
- **Projects COVID-19 hospitalized cases** to directly address the question of hospital capacity and provide a more accurate picture on COVID-19's impact on the healthcare system

## Model Structure (SEIR)

# Projections are made for each Emergency Response region with sufficient data

- **Low levels of daily COVID-19 hospitalizations in the Northeast and Northwest regions** limit the ability to generate projections for these regions
  - Northeast: Average of 4 daily confirmed or suspected COVID hospitalizations from 3/26 to 6/1
  - Northwest: Average of 17 daily confirmed or suspected COVID hospitalizations from 3/26 to 6/1
- **Projections are available for all other regions**
