Missouri
Viral Hepatitis
Prevention, Care and Treatment
Resource Directory

Created by
Missouri Viral Hepatitis Committee
Missouri Department of Health and Senior Services
Updated March 2016
Page purposely blank for formatting
Viral Hepatitis is a major public health problem in Missouri. Nationwide, it is estimated that more than 1.2 million people are living with Chronic Hepatitis B and at least 3.2 million people are living with chronic Hepatitis C. It is also estimated that up to 75% of people infected with Hepatitis C do not know it.

The Missouri Viral Hepatitis Committee is community driven and provides an opportunity for people interested in viral hepatitis prevention, care and treatment to work together to address the needs of Missouri citizens related to viral hepatitis. The committee is comprised of private citizens, community based organizations, state and local public health agencies, behavioral health and substance abuse treatment providers, healthcare providers and health educators. For more information about the committee you can visit www.health.mo.gov/viralhepatitis.

The Committee is dedicated to our mission to reduce the burden of viral hepatitis in Missouri. To accomplish our mission, one role of the committee is to provide guidance regarding Missouri’s Viral Hepatitis Action Plan. The Plan includes raising public awareness through education, providing screening tests in local communities and referring clients to providers who treat viral hepatitis. To further assist with accomplishing our mission the committee wanted to compile a directory to inform the general community and providers about the viral hepatitis services available in the state of Missouri. This directory was created by the Missouri Viral Hepatitis Committee and the Missouri Department of Health and Senior Services, Viral Hepatitis Program.
UNDERSTANDING VIRAL HEPATITIS

What is Hepatitis?

Hepatitis means inflammation of the liver. Hepatitis is also the name of the family of viral infections that affect the liver. The most common types are Hepatitis A, Hepatitis B and Hepatitis C. More information is below and you can also visit www.health.mo.gov/viralhepatitis.

Your Liver Health

Weighing about three pounds, the liver functions as a unique organ with many crucial roles to sustain life. From circulation to digestion, the liver continually processes the blood used by the rest of the body. The liver performs over 500 functions to keep us healthy including converting food into energy and substances needed for life and growth, storing glycogen (a blood sugar regulator), amino acids, protein and fat. It also makes the enzymes and bile that help digest food and neutralizes harmful toxins and waste.

The Hepatitis viruses attack the liver and can remain without symptoms, sometimes for decades. Some symptoms may include fever, fatigue, loss of appetite, nausea, vomiting, abdominal pain, grey colored stools, joint pain and jaundice.

If you have a hepatitis virus you should: 1) Stop or reduce your alcohol intake as much as possible [alcohol harms the liver] 2) Eat a healthy, low-fat, low salt diet 3) Drink a lot of water 4) Get enough rest and moderate exercise 5) Get vaccinated for HAV and HBV (if you haven’t been) 6) See your physician for regular check-ups

Hepatitis A Virus (HAV)

Hepatitis A is an acute liver disease caused by the hepatitis A virus. It lasts from a few weeks to several months and does not lead to a chronic infection. It is transmitted when the fecal matter (even microscopic amounts) of a person infected with hepatitis A is ingested by another person. This can happen by close person-to-person contact or through contaminated food or drinks. There is a vaccine available to prevent contracting hepatitis A.

Hepatitis B Virus (HBV)

Hepatitis B is a liver disease caused by the hepatitis B virus. It ranges in severity from a mild illness, lasting a few weeks (acute), to a serious long-term (chronic) illness that can lead to liver cancer. It is transmitted when the blood, semen or vaginal fluid of a person infected with the hepatitis B virus enters the body of someone not infected. This can happen through sexual contact, sharing needles or syringes or other drug equipment. Hepatitis B can also be passed from an infected mother to her baby at birth. There is a vaccine available to prevent contracting hepatitis B.

Hepatitis C Virus (HCV)

Hepatitis C is a liver disease caused by the hepatitis C virus. It ranges in severity from a mild illness, lasting a few weeks (acute), to a serious long-term (chronic) illness that can lead to liver cancer. It is transmitted when the blood of a person infected with the hepatitis C virus enters the body of someone not infected. Most people become infected through sharing needles or syringes or other drug equipment. It can also be spread through tattoo needles and equipment. Before 1992, when widespread screening of the blood supply began it was also commonly spread through blood transfusions and organ transplants, so many do not realize they are infected from the past. There is not a vaccine to prevent hepatitis C.

Why is it important to get tested for Hepatitis C?

- Millions of Americans have Hepatitis C, but most do not know it. Many people do not know when or how they got infected.
- About 8 in 10 people who get infected with Hepatitis C develop a chronic or lifelong infection.
- People with Hepatitis C often have no symptoms.
- Many people live with an infection for decades without feeling sick.
- Hepatitis C is the leading cause of liver cancer and the leading cause of liver transplants.
- New treatments are available for Hepatitis C that ‘cure’ the virus.

Who should get tested for Hepatitis C?

- Anyone born between 1945-1965, that has never been tested.
- Anyone who has injected drugs, even just once or many years ago.
- Anyone who has ever shared any injection equipment (needles, syringes, cooker, cotton, water, etc).
- Anyone who has ever received a tattoo or piercing with shared equipment (needles, ink, etc) or while incarcerated or in other non-professional settings.
- Anyone who has or had a sexual partner who has injected drugs or shared injection equipment.
- Anyone who has or had a sexual partner who has Hepatitis C.
- Anyone who has chronic liver disease or has HIV/AIDS.
- A man who has had sex with other men.

Other people who may want to get tested:

- A person who has shared personal care equipment (Razors, toothbrushes, nail clippers, etc) with someone who has Hepatitis C.
- Anyone, such as a healthcare worker, who has had an accidental needle stick injury.
- Anyone who has or had anonymous sexual partners, multiple sexual partners or other high risk sexual activity.
- Anyone who had a blood transfusion or organ transplant before 1992 or received clotting factors before 1987.
- Anyone born to Hepatitis C positive mother.

Getting Tested for Hepatitis C – How does it work?

A blood test, called a Hepatitis C Antibody test (sometimes called the Anti-HCV test) is used to find out if someone has ever been infected with Hepatitis C. The Anti-HCV test looks for antibodies to the Hepatitis C virus. Antibodies are chemicals released into the bloodstream when someone gets infected. Test results can take anywhere from a few days to a few weeks to come back. New rapid tests are now available in some settings and the results of these tests are available in 20 minutes.

Non-Reactive or Negative Hepatitis C Antibody Test

A non-reactive or negative antibody test means that you have not been exposed to the Hepatitis C virus. However, if you think you may have been exposed in the last 6 months, you will need to be tested again. Sometimes it takes the body a little longer to produce the antibodies.
Reactive or Positive Hepatitis C Antibody Test

A reactive or positive antibody test means that you have been infected with the hepatitis C virus at some point in time. Once you have been infected these antibodies will be present in your blood the rest of your life, even if you clear the virus or become cured. A reactive antibody test does not necessarily mean that you are currently infected. A follow up test looking for virus in the blood (viral load) is needed.

Confirmatory Testing - Diagnosing Hepatitis C

If the antibody test is reactive (positive) you need an additional test to confirm that you currently have a Hepatitis C infection. This test, looking for viral load, is called an HCV RNA test. If the follow up test is:

**Negative (or undetected)** – this means you were infected with Hepatitis C, but the virus is not now present in your blood.

**Positive** – this means you currently have the virus in your blood and you will need to talk to a doctor experienced in diagnosing and treating Hepatitis C, usually a Gastroenterologist or a Hepatologist.

Every Local Public Health Agency offers Hepatitis A and B vaccinations. Local Public Health Agencies can offer free Hepatitis B vaccines for underinsured or uninsured adults (19 and over) who meet the appropriate (317 funding) criteria.

The HealthMap Vaccine Finder will help you find Hepatitis A and Hepatitis B Vaccines available in your area.

For Information on Immunizations and the diseases they prevent you can go to http://health.mo.gov/living/wellness/immunizations/index.php
Local public health agencies located throughout Missouri work to improve the health of thousands of Missourians every year. Missouri’s 115 local public health agencies operate independently of each other and are independent of state and federal public health agencies. The local agencies work directly with the Missouri Department of Health and Senior Services through contracts to deliver public health services to the communities they serve. The state health department also provides technical support, laboratory services, a communication network and other services to support local public health efforts. Local public health agencies also work with numerous partners, including private health care professionals and health advocacy organizations, to improve the health of Missourians. Information on what services each Local Public Health Agency provides can be found at [http://health.mo.gov/living/lpha/lphas.php](http://health.mo.gov/living/lpha/lphas.php). You can also contact the Center for Local Public Health Services at 573-751-6170.

For many people, living with Hepatitis C is not easy. On a daily basis, they may be faced with making many important personal decisions that can affect almost every area of their lives. The best way to live well with Hepatitis C is to be educated so that they can receive optimal medical care. It is also very important that they seek support from family, loved ones, friends and peers. One important component of the process is to discuss and share experiences about Hepatitis C with others. A peer support group is good place to learn about Hepatitis C and find support.

Who would benefit from a Hepatitis C support Group?
- People who have just been told they have Hepatitis C
- People who are being monitored, but not treated, for Hepatitis C (some people have symptoms and some do not)
- People thinking about treatment or are currently in treatment for Hepatitis C
- Family members and close friends of someone who has Hepatitis C

What are the benefits of a support group?
- To help individuals affected by Hepatitis C work though different issues
- Give each other help and advice
- Give each other emotional support
- Help each other make better choices in their lives
- Help each other feel safe and secure
- Health each other feel better and understand themselves
- Learn how to teach others about the basics of Hepatitis C

Where can you find Hepatitis C support group information?

Support Group Materials and Lessons are available at this link - [http://www.hcvadvocate.org/community/Groups.asp](http://www.hcvadvocate.org/community/Groups.asp)

If you are interested in starting a support group in your area, these materials will help you get knowledge about getting started.
Support and other information is available at:

Many brochures are available for free!
**Abdomen** – The portion of the body located between the chest and the pelvis. Contains the stomach, lower part of the esophagus, small and large intestines, liver, gallbladder, spleen, pancreas, and bladder.

**Acetaminophen** – A type of medication used to relieve pain and fever. An example is Tylenol.

**Acute illness** – Acute refers to the short-term, initial stage of infection.

**Adipose tissues** – Fatty tissues.

**Albumin** – A protein produced by the liver that circulates in the blood.

**Alpha-fetoprotein (AFP)** – A protein produced by cancerous liver cells.

**Anemia** – Condition in which there is a reduction in the number of circulating red blood cells, usually resulting in a decrease in the amount of oxygen in the blood.

**Antibody** – A molecule produced by the immune system in response to a foreign body such as a virus or bacteria. Antibodies circulate in the blood to protect against infection.

**Antigen** – A foreign substance that the body’s immune system identifies as potentially harmful.

**Ascites** – Fluid accumulation in the abdomen.

**Asymptomatic** – Without symptoms or signs of illness.

**Autoimmune** – A condition in which the body produces antibodies against normal parts of the body to such an extent as to cause tissue injury.

**Benign** – Not recurrent or progressive.

**Bile** – A fluid that is stored in the gallbladder for release when needed. Bile is necessary for the digestion of fats – it dissolves fat into small globules (similar to the way that detergent lifts oil off greasy plates). Bile also assists in the absorption of fat-soluble vitamins (i.e., vitamins A, D, E, and K) and converts beta-carotene to vitamin A.

**Bilirubin** – A product of red blood cells.

**Biopsy** – The removal of a small piece of living tissue for examination under a microscope. Usually performed to establish a diagnosis.

**Chemotherapy** – Chemical agents that have a specific and toxic effect upon the disease-causing microorganism.

**Cholesterol** – A soft, waxy substance found in all parts of the body. It is made in the liver and is also found in animal and dairy products.

**Chronic illness** – An illness that lasts longer than six months.

**Cirrhosis** – Extensive scarring of the liver.

** Decompensated cirrhosis** – A condition in which the liver becomes so scarred that blood can no longer flow through it.

**Encephalopathy** – Disease of the brain. Symptoms include confusion, disorientation, and insomnia, and can progress to coma.

**Endemic** – A disease that occurs continuously in a particular population.
Epidemiology – Investigation of the causes of, and ways to control, diseases.

Esophagus – The tube that carries food from the mouth to the stomach.

Fibrous – Composed of or containing fibers.

Fulminant – Sudden onset, most severe.

Gastroenterologist – A doctor that specializes in the function and disorders of the esophagus, stomach, pancreas, intestines, and liver.

Glucose – A sugar formed during digestion.

Glycogen – A substance found in the liver and muscles that is easily converted to glucose for energy.

Hemodialysis – The process of filtering the accumulated waste products from the blood of a person whose kidneys are not functioning properly, using a kidney machine.

Hepatitis – Inflammation of the liver. It may be caused by a variety of agents, including viral infections, bacterial invasion, and physical or chemical agents. Symptoms include fever, jaundice, and, usually, an enlarged liver.

Hepatitis A – Formerly called infectious hepatitis, hepatitis A is caused by the hepatitis A virus (HAV). It is an acute infection and does not progress to chronic hepatitis or cirrhosis. Most patients recover completely within six to ten weeks. Hepatitis A is spread mainly via feces and contaminated food and water. A vaccine against the hepatitis A virus is available.

Hepatitis B – Formerly called serum hepatitis, it is caused by the hepatitis B virus (HBV). About 10% of cases progress to chronic infection. It is transmitted through sexual contact with an infected individual, injection drug use, and other exposure to infected body fluids. A vaccine against the hepatitis B virus is available.

Hepatitis C – A form of hepatitis that was previously known as non-A, non-B hepatitis and is caused by the hepatitis C virus (HCV). The Centers for Disease Control estimates 26,000 new cases each year, a marked decline in new infections since the virus was identified in 1988. There is no vaccine against hepatitis C virus.

Hepatitis D – Also called delta hepatitis, hepatitis D is caused by the hepatitis D virus (HDV). A person cannot be infected with HDV without current or simultaneous infection with hepatitis B virus. Hepatitis D infection is rare in the U.S. and occurs primarily in recipients of multiple blood transfusions, including patients with hemophilia or undergoing renal dialysis, and among those who share contaminated needles.

Hepatitis E – Also referred to as enterically transmitted non-A, non-B hepatitis, hepatitis E is caused by a waterborne virus (HEV). It is rare in the U.S. and occurs primarily in developing countries. Hepatitis E infection results in an acute infection much like hepatitis A. It does not cause chronic infection. It is spread by fecal contamination in water.

Hepatocellular carcinoma (HCC) – Liver cancer.

Hepatocytes – Liver cells.

Hepatologist – A doctor who specializes in the study and treatment of liver disease.

Immunoglobulin – One of a family of closely related though not identical proteins capable of acting as antibodies.

Immunology – The branch of medicine that focuses on the immune system, immunity, and allergy.
Jaundice – Yellowing of the skin and whites of the eyes.

Laparoscopic biopsy – A medical procedure performed when a tube (laparoscope) is inserted through an incision in the abdomen and a piece of tissue is removed.

Lipid – Component of fat.

Lipoproteins – A complex of lipids and proteins that carries lipids around the body.

Liver – The largest glandular organ in the body. It has many functions that include, but are not limited to the production of protein and cholesterol, the production of bile, the storage of sugar in the form of glycogen, and the breakdown of carbohydrates, fats, and proteins. The liver also breaks down and excretes many medications.

Malaise – Discomfort, uneasiness often indicates infection.

Nucleoside analogues – A class of HIV medications.

Pancreas – A long, irregularly shaped gland lying behind the stomach that secretes digestive enzymes and produces insulin.

Pathologist – A specialist in diagnosing the abnormal changes in tissues removed at operations and postmortem examinations.

Perinatal – Concerning the period beginning after the 28th week of pregnancy through 28 days following birth.

Perinatal Transmission – Transmission of an infectious disease from mother to infant. It can happen in the uterus, or during or after birth.

Peripheral edema – Fluid build up in the feet and ankles.

Phospholipid – A phosphorus-containing lipid found in cell membranes.

Polymerase inhibitors – A compound that stops an essential enzyme needed for viral replication.

Portal hypertension – High pressure in the liver, intestines, and spleen.

Prophylaxis – A type of treatment to prevent disease or stop it from spreading.

Protease inhibitor – A compound that breaks down proteins, inhibiting the replication of viruses such as HIV.

Prothrombin time (PT) – A measure of blood clotting.

Serologic testing – Blood test.

Transvenous biopsy – A procedure during which a tube is inserted into a vein in the neck, then a needle is put into the catheter to remove tissue samples.

Ultrasound – A test that uses a wand, which is placed on a body part such as the abdomen and moved back and forth to examine the shape, size, and appearance of the liver.

Variceal bleeding – Bleeding from blood vessels in the esophagus. This may occur in patients with cirrhosis.
